VetoPoint AI

Competition Master Document

Team: **Trinorte** · Members: Brais, Adrián, Rina

Identity (Task 1)

Mission

To empower enterprises to adopt autonomous AI safely by providing an intelligent governance layer that prevents risky actions, ensures regulatory compliance, and keeps humans in control of critical decisions.

Vision

To become the global standard for AI action governance, enabling a future where businesses can fully trust autonomous AI to execute tasks without compromising security or ethics.

Main Purpose

To bridge the gap between AI innovation and enterprise security. VetoPoint exists to eliminate the fear of "rogue AI" or operational hallucinations, acting as an intelligent firewall so companies can automate tasks faster and safer.

Values

- **Security-First:** We prioritize enterprise data protection and risk mitigation above all else.
- **Transparency (Explainability):** We make AI decision-making visible, ensuring every AI action can be audited and understood.
- **Human-in-the-Loop:** We believe AI should augment human capabilities, not replace human judgment when the stakes are high.
- **Innovation Without Fear:** We build the guardrails so IT teams can confidently deploy new AI tools instead of blocking them.

Target Customer

- **Primary Buyers:** Chief Information Security Officers (CISOs), IT Directors, and Chief Compliance Officers.
- **Company Profile:** Mid-to-large enterprises (B2B), particularly those in highly regulated industries such as Finance, Banking, Healthcare, and Legal services, where a single wrong AI action could result in massive fines or reputational damage (especially under the EU AI Act).

Problem (Task 2)

Employees increasingly use AI to summarise contracts, analyse customer data, write reports and review internal documents — often pasting confidential information into unapproved tools without understanding the risk.

Microsoft's 2024 Work Trend Index found that 75% of knowledge workers already use AI at work, and 78% of AI users bring their own tools rather than company-approved ones ("Bring Your Own AI"). IBM's 2025 Cost of a Data Breach Report adds that 63% of organisations have no AI-governance policy, 97% of AI-related breaches involved organisations lacking proper AI access controls, and heavy "shadow AI" raised average breach costs by approximately $670,000.

AI Solution (Task 3)

VetoPoint is an enterprise AI data-loss-prevention (DLP) platform. It works as an intelligent proxy (browser extension + API) that sits between employees and third-party AI tools like ChatGPT, Copilot and Claude.

How It Works

When an employee submits a prompt, VetoPoint intercepts it before it leaves the company. Its AI scans the content for confidential data (client names, financials, internal documents) and assigns a real-time risk score. Safe prompts pass through instantly; risky ones are redacted or blocked, and everything is logged for compliance.

The Role of AI

VetoPoint does not rely on manual rules or rigid scripts — it uses AI models to audit other AIs:

- **Intent Recognition:** NLP models translate an agent's code or API request to understand the true intent behind the requested action, detecting and classifying sensitive content faster and more consistently than manual review.
- **Dynamic Risk Scoring:** A proprietary AI evaluates the risk of each action in real time based on context — which agent is requesting it, what data it is trying to access, at what time, and whether it complies with internal policies and regulations such as the EU AI Act. It assigns a Risk Score (1–100); only low-risk actions are automated, while high-risk ones require a human "Veto."

Improvement

- **Cost:** Prevents massive financial and reputational disasters caused by operational "hallucinations" and costly breaches.
- **Quality / Security:** Provides an immutable audit log of every decision — why an AI action was allowed, redacted or blocked.
- **Speed:** Enables safe AI use without banning it outright.

Company and Brand Design (Task 4)

- **Company Name:** VetoPoint AI
- **Team Name:** Trinorte
- **Slogan:** *"Others secure the prompt. VetoPoint secures the action."*
- **Logo & Brand Colours:** see brand assets submitted separately (`logo.png`, `logo-static.svg`)
- **Company Description:** VetoPoint is an AI-governance layer that catches confidential company

data before it leaves for tools like ChatGPT, Copilot, Gemini or Claude — and flags risky AI-agent actions before they execute.

Responsible AI (Task 9)

- **Data Privacy:** The product is itself a privacy control (strong GDPR angle). The EU AI Act, with broad application from 2 August 2026, pressures companies to document and govern AI use — VetoPoint is built for exactly that.
- **Bias / Fairness:** Risk-scoring models are trained and audited to avoid discriminating by department, seniority or user profile, and are reviewed periodically to detect drift or unintended bias in what gets flagged.
- **Transparency:** Every risk score and block/redact decision is explainable and logged, so employees and auditors can see exactly why an action was flagged.
- **Human Oversight:** High-risk actions always require a human "Veto" decision; the system only automates what falls within pre-approved low-risk thresholds.
- **Responsible Use:** VetoPoint follows privacy-by-design principles itself, minimising data retention and processing only what is necessary to assess risk.

Suggested Team Roles

- Team Leader and Business Strategist
- AI and Product Lead — **Brais**
- Marketing and Presentation Lead

VetoPoint AI — Financial Revenue Model

VetoPoint uses a high-value enterprise SaaS model. Companies pay an annual licence to control and audit actions performed by AI agents.

A hybrid model is commercially credible because enterprise security products already use both per-user and consumption-based pricing: Cloudflare publishes per-user pricing for its Zero Trust offering, while Microsoft Purview offers pay-as-you-go consumption billing for some capabilities. VetoPoint adapts this logic to charge for protected AI agents and reviewed actions.

1. Revenue Formula

Annual revenue = platform licence + protected AI agents + action volume + premium modules + implementation services

The company does not charge employees or ordinary users. It sells directly to:

- Banks and insurers
- Healthcare organisations
- Governments
- Large companies
- Technology and consulting firms
- Regulated organisations using autonomous AI agents

2. Pricing Structure

Paid Pilot — €25,000

Three-month controlled deployment for one department. Includes: up to three AI agents, three approval workflows, risk analysis, policy enforcement, audit trail, management dashboard and a pilot evaluation report. The pilot fee can be credited toward the first annual contract, encouraging conversion.

Annual Subscription Plans

Plan	Annual Licence	Designed For
VetoPoint Core	€40,000	Small regulated companies or one department
VetoPoint Business	€95,000	Medium organisations with several AI agents
VetoPoint Enterprise	€250,000+	Banks, governments and large corporations

Core includes: 5 protected AI agents; 250,000 reviewed actions annually; standard policy templates; one approval workflow; basic dashboard; email support.

Business includes: 25 protected AI agents; 2 million reviewed actions annually; custom organisational policies; multiple approval levels; compliance reporting; advanced analytics; priority support.

Enterprise includes: custom number of AI agents; high-volume action processing; private-cloud or on-premises deployment; integration with banking and corporate systems; custom risk models; role-based access; regulatory reports; dedicated account manager; service-level agreement.

3. Additional Revenue Streams

Implementation and Integration

Charged once when a customer joins. Covers connecting company systems, configuring approval workflows, importing policies, establishing user roles, security testing and training administrators.

Customer Type	Implementation Fee
Small deployment	€15,000
Medium deployment	€30,000–€50,000
Enterprise deployment	€75,000–€150,000

Usage Overages

Customers exceeding their included action volume pay approximately €0.01–€0.03 per additional action reviewed. For example, one million additional actions at €0.02 would generate €20,000 in extra revenue.

Premium Modules

Add-on	Annual Price
Financial transaction control	€30,000
Privacy and data-governance module	€25,000
AI Act and compliance reporting	€20,000
Advanced fraud detection	€40,000
Agent identity verification	€30,000
Executive risk analytics	€25,000
Private deployment	€50,000–€150,000

Professional Services

- Responsible-AI audit: €15,000–€50,000
- Custom policy design: €10,000–€30,000
- Employee and management training: €5,000–€20,000
- Security assessment: €15,000–€40,000
- Premium support: 15–20% of the annual licence

The objective is for at least 75% of revenue to remain recurring, rather than relying too heavily on consulting.

4. Illustrative Five-Year Projection

This is a base-case target scenario, not a guaranteed forecast.

The average contract value rises because the customer mix gradually shifts from pilots and departmental deployments toward enterprise-wide contracts.

Year	Customers	Avg. Recurring Rev./Cust.	Total Revenue	Est. EBITDA
1	6	€50,000	€420,000	−€780,000
2	18	€70,000	€1.65 million	−€490,000
3	45	€90,000	€5.13 million	€910,000
4	90	€110,000	€12.02 million	€3.78 million
5	160	€130,000	€24.63 million	€9.69 million

5. How the Projection Is Calculated

Year 1: 6 customers × €50,000 recurring revenue = €300,000; 6 implementations × €20,000 = €120,000. **Total: €420,000.**

Year 3: 45 customers × €90,000 recurring revenue = €4.05 million; 27 new implementations × €25,000 = €675,000; modules and professional services = €405,000. **Total: €5.13 million.**

Year 5: 160 customers × €130,000 recurring revenue = €20.8 million; 70 new implementations × €25,000 = €1.75 million; premium modules and services = €2.08 million. **Total: €24.63 million.**

6. Estimated Cost Structure

Direct operating costs are approximately 16–24% of revenue, covering cloud infrastructure, AI-model usage, security monitoring, technical customer support, data storage and third-party software licences. The projected gross margin improves as the company scales:

Year	Est. Gross Margin
Year 1	76%
Year 2	79%
Year 3	82%
Year 4	83%
Year 5	84%

Main operating expenses include software engineering, cybersecurity and penetration testing, compliance and legal work, enterprise sales, customer success, product development, insurance and administration. The company is expected to operate at a loss initially because enterprise software requires significant development, security certification and a long sales process.

7. Break-Even Point

Under this model, VetoPoint reaches operational break-even during Year 3. A simplified break-even target would be: approximately 35–40 customers, an average contract value of €85,000–€95,000, and annual recurring revenue of roughly €3.5–€4 million.

8. Customer Economics

A target enterprise customer might produce: annual licence €95,000; implementation €35,000; premium module €25,000; first-year revenue €155,000; following-year recurring revenue €120,000. With strong retention, one customer could generate €500,000–€700,000 over five years.

The company targets: contract duration 2–3 years; annual customer retention above 90%; gross margin above 80%; customer-acquisition payback below 18 months; recurring revenue share 75–85%.

9. Initial Investment Request

Investment sought: €750,000

Use of Funds	Share
Product and AI development	40%
Cybersecurity and compliance	20%
Enterprise integrations	15%
Sales and pilot acquisition	15%
Legal and operations	10%

Within 18 months, the investment should achieve: a production-ready minimum viable product; three paid enterprise pilots; at least two annual contracts; security testing; initial compliance documentation; integrations with major enterprise AI systems; and approximately €300,000–€500,000 in contracted annual recurring revenue.

Pitch-Ready Explanation

VetoPoint operates through annual enterprise subscriptions ranging from €40,000 to more than €250,000. Customers also pay for implementation, action volume, private deployment and specialised compliance modules. Our target is to reach 45 institutional customers and more than €5 million in annual revenue by Year 3, becoming profitable as recurring subscription revenue scales.

Strong Financial Statement

One protected action can prevent a loss worth millions. That allows VetoPoint to charge enterprise prices while still delivering a clear financial return to the customer.

"Others secure the prompt. VetoPoint secures the action."
